## Lampiran 2. Langkah-langkah metode analisis Asam Lemak bebas (ALB)

- Timbang sampel sebanyak 5 gram dalam erlenmeyer 250 ml (catat berat sampel).
- Tambahkan 50 ml larutan ipa yang telah di netralkan.
- Tambahkan 3 tetes indikator *phenolphthalein* (campur hingga homogen).
- Titiasi dengan larutan NaOH 0,1N sampai berwarna merah bata.
- Setelah titiasi akhir titiasi, catat volume NaOH 0,1 N yang digunakan.
- Dihitung dengan rumus:
- $$\%ALB = \frac{\text{volume NaOH} \times 25,6 \times \text{normalitas NaOH}}{\text{Berat sampel}}$$

## Lampiran 3. Langkah langkah metode analisis *Unstripped Bunch* (USB)

- Mengamati janjang kosong di *empty Bunch conveyor*.
- Menggunakan 2 alat *hand tally counter* :  
1 alat untuk menghitung jumlah janjang (200)  
1 alat untuk menghitung brondolan yang masih menempel di janjang (W1)
- Lalu dihitung menggunakan rumus :
- $$\%USB = \frac{W1}{200} \times 100\%$$

## Lampiran 4. Langkah langkah metode analisis efisiensi *ripple mill*

- Ambil sampel 2 kg dari sampel yang di ambil per 2 jam.
- Kemudian di quatering.
- Ambil 1 kg dari 4 bagian itu.

- Sortasi sampel menjadi *nut* utuh, *nut* pecah, dan *kernel* pecah.
- Timbang masing-masing sampel tersebut.
- Lalu dihitung menggunakan rumus:
- $Nut\ utuh = \frac{W_2}{W_1} \times 100\%$
- $Nut\ pecah = \frac{W_3}{W_1} \times 100\%$
- $Kernel\ pecah = \frac{W_4}{W_1} \times 100\%$
- $W_1$  = Berat sampel (g)
- $W_2$  = Berat *nut* utuh (g)
- $W_3$  = Berat *nut* pecah (g)
- $W_4$  = Berat *kernel* pecah (g)
- Lalu menghitung efisiensi *ripple mill* dengan rumus:
- Efisiensi *ripple mill* (%) =  $100\% - (\% \text{ nut utuh} + \% \text{ nut pecah})$
